

Satellite Roller Screws

ABSSAC
PRECISION MOTION SINCE 1982

SATELLITE ROLLER SCREWS

Established in 1970, ROLLVIS SA quickly started to focus exclusively on design, manufacturing and marketing of satellite roller screws under the trademark «Rollvis swiss». Our products represent today the reference for high performance linear motion applications. Our factory is equipped with the most powerful machines to achieve the tightest tolerances on roller screws from very small quantities to larger batches. Following a continuous improvement path, Rollvis SA never stopped in investing in new manufacturing technologies and skills, in the business park of Plan-les-Ouates in Geneva. The Rollvis high tech spirit and the scale of the company have always been preserved to ensure the best reactivity, flexibility and support to customer requirements. Five decades of experience combined with the latest technologies enable Rollvis screws to be the preferred choice in many demanding or complex applications for industrial, aerospace or defense segments and for any others where the best is required.

Contents

To ensure that Rollvis roller screws always get benefits of the latest technologies, we have setup a new Research & Development department with a highly qualified team, the most recent softwares and technologies in manufacturing, control & testing. Products & Processes are permanently optimized to make Rollvis screws ones of the best on the market regarding reliability, performance and availability. Production and Quality systems are organized according to the latest ISO and EN standards. Testimonials from many high end customers praise Rollvis screws for the outstanding quality. With a global presence on all continents through subsidiaries or high tech distributor partners, we offer support and deliver our solutions wherever you are.

Preferred range

	Screw RV range	de 22 to 39
	Screw HRV range	de 40 to 45
	Screw RVI range	de 46 to 51
	Screw RVR range	de 52 to 57
	Screw RVD range	de 58 to 63
	Bearing units BU	de 64 to 68

ROLLVIS satellite roller screws are used to transform rotary movements into linear movements and vice versa. The rolling elements are threaded rollers between the screw and the nut. The high number of points of contact enables satellite roller screws to support very heavy loads. The ROLLVIS range comprises satellite roller screws with no recirculation (**RV** and **HRV** types), inverted roller screws (**RVI** type), Differential roller screws (**RVD** type) and screws with recirculating rollers (**RVR** type). Bearing units are also proposed to equip the different roller screw designs.

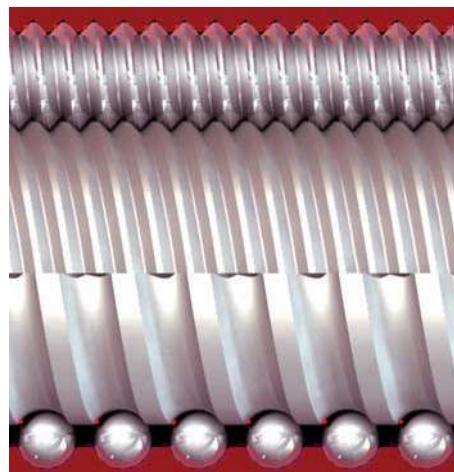

Satellite roller screws compared to ball screws

Satellite roller screws mainly differentiate from ball screws because the load transfer elements are threaded rollers instead of balls. The main advantage of satellite roller screws is that they have a much higher number of contact points and the thread profile is virtually equivalent to a very large ball diameter.

Load capacity and lifespan

The main advantage of roller screws compared to ball screws is that their admissible static and dynamic load capacities are higher.

The rolling function is ensured by threaded rollers instead of balls and the load is spread over a higher number of points of contact.

Speed & acceleration

Satellite roller screws can rotate much faster and support much greater acceleration.

RV satellite roller screws are designed so that the rollers are not recirculating. This means the mechanism can reach up to twice the rotation speed of a ball screw. Acceleration can reach up to 3g.

Lead & pitch

Planetary roller screws can be designed with much smaller leads than ball screws.

The lead of roller screws (axial travel per turn) can be very small. It is typically limited to 1mm for small diameters of RV and cannot be reduced below a certain limit because threads require to be multi-starts. The thread pitch is defined as a function of the lead divided by the number of starts. RVR recirculating screws are single or double starts which give a pitch equal or at least half the lead. RVD differential screws could have lead down to few hundredths or tenths of mm if needed. Leads can have decimal values and the flexibility often enable direct drive. This is an advantage compared to ball screws. The lead can be chosen and realised without any geometrical changes of both the screw shaft and the nut body, which allows design iterations with minor changes of the envelope while keeping very high load capacities. In a ball screw the minimum lead will be limited by the size of the ball that can fit in the thread. Small leads for ball screws mean then small balls and very small capacity ratings consequently.

Rigidity & strength

The high number of contact points and the geometry of the contacts give a satellite roller screw greater rigidity and shock tolerance than a ball screw.

Advantages of the Rollvis satellite roller screws

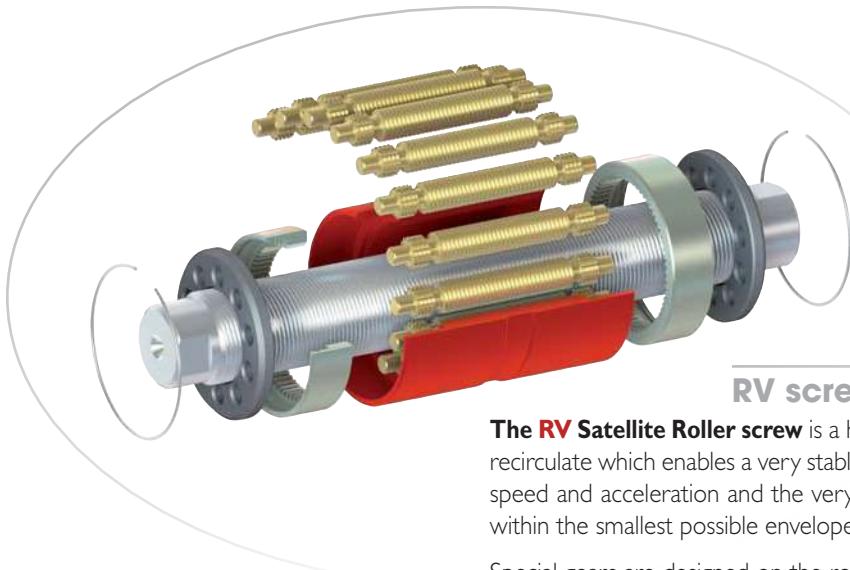

- High axial load capacity
- Long lifespan
- High efficiency
- No backlash
- Extremely high rigidity
- Accuracy down to 6 µm/300 mm
- High rotation speed (RV types)
- Small leads (from 0.25 mm) with large diameters (RVR types)
- Thin leads (to 0.02 mm) with medium diameters (RVD types)
- High acceleration and deceleration
- High reliability
- Easy customization
- Available in standard or Stainless materials

Examples of applications

Rollvis roller screws have successfully equipped many application segments such as:

- | | | | |
|--|---|---------------------|-------------------------------|
| • Machine tools | • Space (rockets, satellites, launchers, spacecrafts) | • Medical | • Laser machines |
| • Measuring machines | • Defence (tanks, guns, missiles, etc.) | • Chemical industry | • Injection moulding machines |
| • Bending machines | • Oil industry | • Optical | • Car industry |
| • Robotics | • Nuclear industry | • Telescopes | • Semicon |
| • Aeronautics (aircrafts, helicopters, drones) | | • Printing | • Presses |

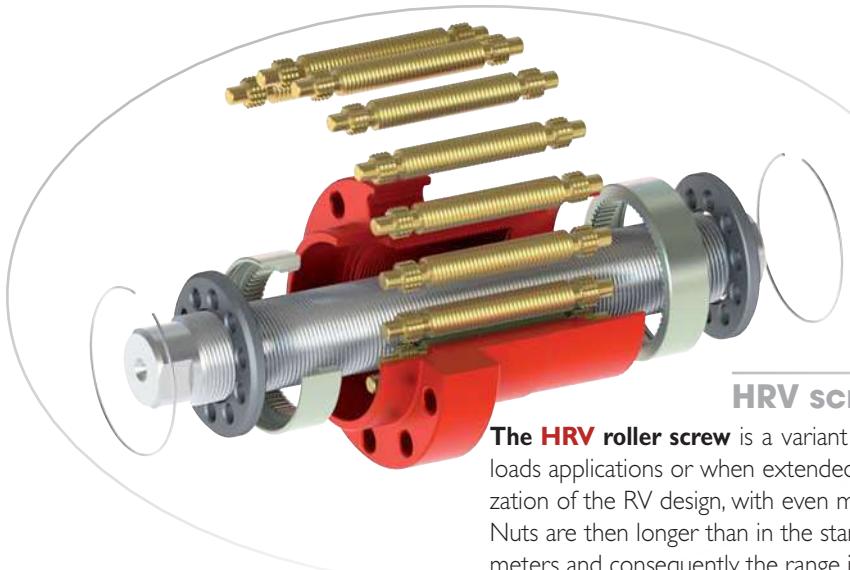

Types of roller screws

RV screws

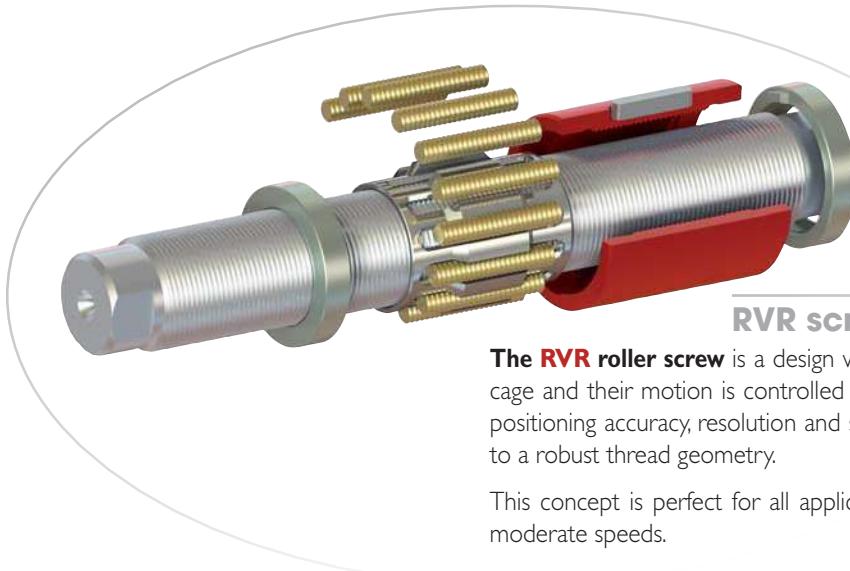

The **RV Satellite Roller screw** is a high precision and robust assembly where rollers do not recirculate which enables a very stable driving torque. The screw can be used under very high speed and acceleration and the very high capacity ratings give an extended and reliable life within the smallest possible envelope.

Special gears are designed on the rollers and nut to maintain a good kinematics even in the most severe conditions.

HRV screws

The **HRV roller screw** is a variant of the satellite roller screw RV designed for very high loads applications or when extended life is required. This design is based on specific optimization of the RV design, with even more contacts in the assembly and a new thread profile. Nuts are then longer than in the standard RV version. HRV series is designed for larger diameters and consequently the range is not available in split nut or with internal preload. Only standard or reduced backlash options are available.

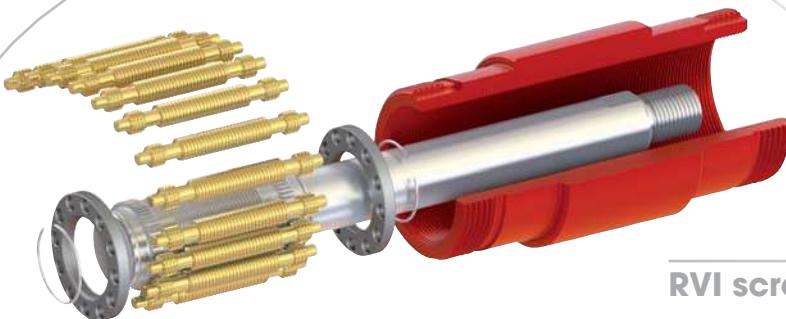

RVR screws

The **RVR roller screw** is a design with recirculating rollers. The rollers are guided within a cage and their motion is controlled by a set of cams. This design combines extremely high positioning accuracy, resolution and stiffness while capacity ratings are at the highest thanks to a robust thread geometry.

This concept is perfect for all applications that need a very high accuracy under small or moderate speeds.

Types of roller screws (ctd.)

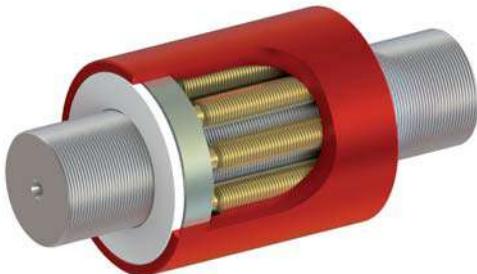

RVI screws

The **RVI Inverted roller screw** is based on the same principle as the RV design and has the same global performances. The rollers do not move axially along the shaft and stroke is travelled within a longer nut.

This concept follows specific design rules which enable higher capacity ratings with smaller leads which consequently reduces the driving torque, optimizes compactness and makes a direct guiding of the shaft possible.

The gears are designed between the rollers and the shaft and give a very smooth and stable synchronization of the rolling.

RVD screws

The **RVD roller screw** is ideally suited for high precision applications, when a high accuracy is needed. Its specific designed and adjusted components allow extremely thin leads down to 0.05 mm or even 0.02 mm. Available strokes are relatively smaller for this type of roller screw. RVD screw requires very specific tools and very high manufacturing accuracy to ensure an extreme a high quality standard.

G5 = 23 µm/300 mm

Total screw shaft length / threaded length - in mm

This model number is defined by Rollvis

* refer to page 6 and ISO 3408-3 for thread accuracy details.

Accuracy

Satellite roller screws are divided into tolerance classes as defined in **ISO 3408-3**. The determining factor is the lead error V_{300p} corresponding to a thread length of 300 mm.

The table opposite shows the tolerance classes:

Tolerance class	V_{300p}
G1	6 $\mu\text{m}/300 \text{ mm}$
G3	12 $\mu\text{m}/300 \text{ mm}$
G5	23 $\mu\text{m}/300 \text{ mm}$

Satellite roller screws are supplied in tolerance classes **G1**, **G3** and **G5**. Higher accuracy classes can be manufactured on demand.

Lead accuracy symbols according to ISO 3408-3

P	→ nominal lead
e_0	→ difference between required lead and nominal lead
V_{300p}	→ difference between actual and nominal lead over 300 mm
e_p	→ difference between actual and nominal lead over a length L_u
V_{up}	→ travel variation over a length L_u
$V_{2\pi p}$	→ travel variation over one revolution
L_u	→ effective travel

Lead error

The lead error e_p relative to effective travel L_u is calculated for the transport satellite roller screw by the following formula:

$$e_p = 2 \cdot \frac{L_u}{1000} \cdot V_{300p}$$

Lead errors e_p for satellite roller screws are shown in the **table opposite**. For tolerance classes **G1** and **G3**, the lead and torque diagrams are supplied with the screws.

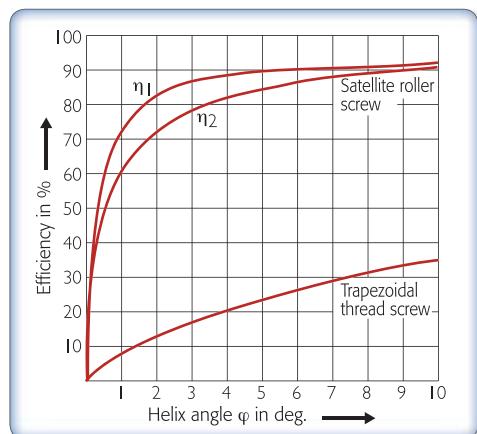

Lead is checked by a CMM measuring machine.

L_u		E_p in microns for tolerance class up to		
From	to	G1	G3	G5
	315 mm	6	12	23
315 mm	400 mm	7	13	25
400 mm	500 mm	8	15	27
500 mm	630 mm	9	16	30
630 mm	800 mm	10	18	35
800 mm	1000 mm	11	21	40
1000 mm	1250 mm	13	24	46
1250 mm	1600 mm	15	29	54
1600 mm	2000 mm			65
2000 mm	2500 mm			77
2500 mm	3150 mm			93

Efficiency

The power effectiveness of the roller screw is defined by the efficiency. It represents the thermal power dissipated at the various contact interfaces. This efficiency is of importance for motor torque calculation. Thus efficiency is essentially determined by the thread's geometry of the components, which will generate the sliding level. Lubrication, speed, level of load, surface finishing, etc... will also have an impact on the efficiency. There are two different values of efficiency depending on how the screw is used, in a direct or indirect mode:

- Direct efficiency η_1 corresponds to the efficiency of the mechanism when the rotation is converted into a translation motion.
- Indirect efficiency η_2 corresponds to the efficiency of the mechanism when a translation motion is converted into a rotation.

← Rollvis satellite roller screws achieve high rates of mechanical efficiency. The figure shows efficiency rates η_1 and η_2 as a function of the helix angle. The efficiency of a trapezoidal thread screw (sliding screws) is shown for comparison. Satellite roller screws, unlike friction screws, are not self-locking.

Nut geometry and shape

Single nuts have low axial backlash. This version can also be manufactured with zero backlash or even with a light preload. The split cylindrical nut is preloaded by clamping the two halves of the nut in a housing. A precision spacer ring is mounted between the two halves to maintain the required level of preloading. Split nuts with a flange at one end have a spacer ring designed to hold the halves apart. The halves are aligned by a parallel key. Double nuts are preloaded in the same way as split nuts. Cylindrical nut types and central flanged ones are then usually preloaded in compression whereas side flanged nuts are preloaded in tension.

SINGLE NUTS:

Nuts in one piece
with axial backlash

Wipers on request

SPLIT NUTS:

Nuts in two pieces, preloaded,
without backlash

Same dimensions as single nuts

Reduced load capacities

Wipers on request

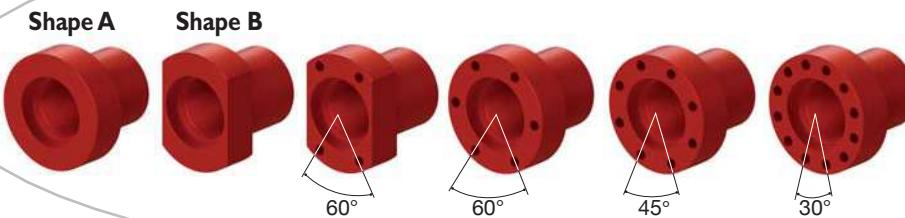

DOUBLE NUTS:

Two single nuts, preloaded,
without backlash

Same load capacities as single nuts

About twice as long as single nuts

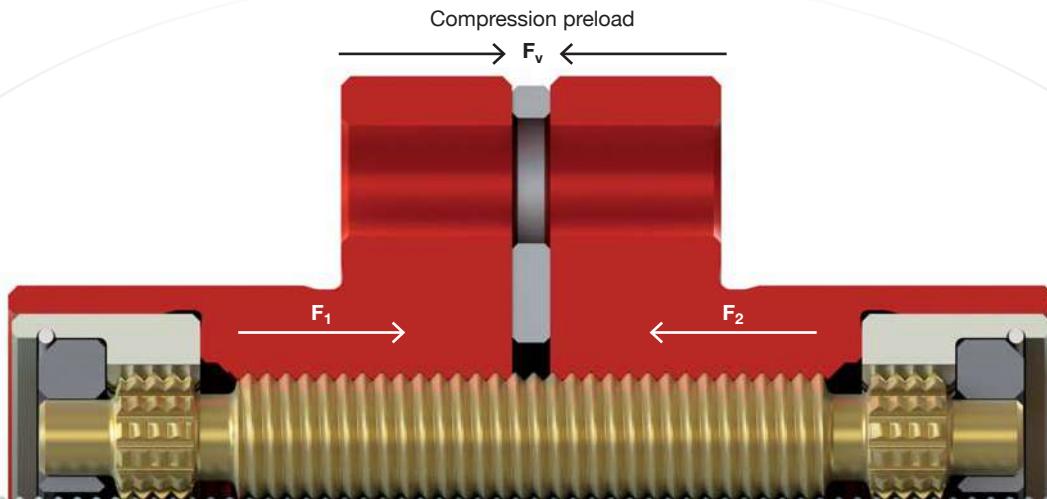

Wipers on request

FLANGE SHAPES

Examples of typical flange shapes

Nut's geometry can be customised as per customer's specific needs.

Preloaded nuts are used to eliminate backlash and increase rigidity.

Preload level should be carefully calculated to achieve the highest stiffness while keeping efficiency high and life the longest. (see figure above).

When considering preloaded nuts, the calculation of the equivalent mean load has to take into account the preload level F_v in case some preload is still active when the screw is exposed to external loads ($F_1 \dots F_n$). This may yield to new individual loads ($F_{1v} \dots F_{nv}$).

When no backlash is required for all operating loads, the preload F_v must be selected according to the maximum load F_{max} .

$$F_v = \frac{F_{max}}{2,83} \text{ [N]}$$

If a satellite roller screw only needs to be backlash-free for a specific load, preload F_v should be selected according to the corresponding load F_n .

$$F_v = \frac{F_n}{2,83} \text{ [N]}$$

Recommended nominal preload is otherwise defined in the product table pages of this catalog (for preloaded split nuts or single nuts).

Resulting load depending on preload F_v

An axial load on a preloaded nut system increases the load of one of the halves and relieves the other from the preloading force. The resulting load can be estimated by the following equations:

Loaded half of nut:

$$\begin{aligned} F_{nv(1)} &= F_v + 0,65 \cdot F_n \quad [\text{N}] \text{ si } F_n < 2,83 \cdot F_v \quad [\text{N}] \\ F_{nv(1)} &= F_n \quad [\text{N}] \text{ si } F_n \geq 2,83 \cdot F_v \quad [\text{N}] \end{aligned}$$

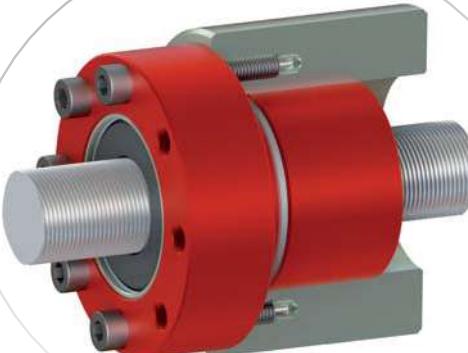

Relieved half of nut:

$$\begin{aligned} F_{nv(2)} &= F_v - 0,35 \cdot F_n \quad [\text{N}] \text{ si } F_n < 2,83 \cdot F_v \quad [\text{N}] \\ F_{nv(2)} &= 0 \quad [\text{N}] \text{ si } F_n \geq 2,83 \cdot F_v \quad [\text{N}] \end{aligned}$$

$F_1 \dots F_n$	[N]	: individual loads
F_v	[N]	: preload force
F_{nv}	[N]	: load resulting from the individual load and preload
F_{ma}	[N]	: equivalent mean load taking into account preload

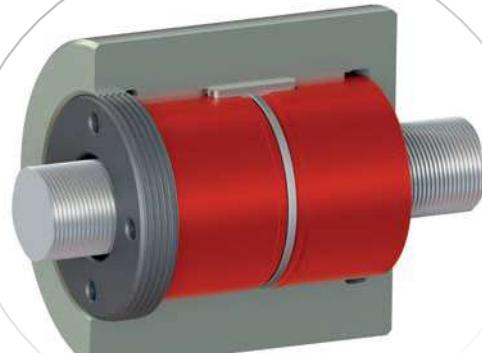

Preloading examples

Preloading with rigid spacer (thickness calibrated by Rollvis)

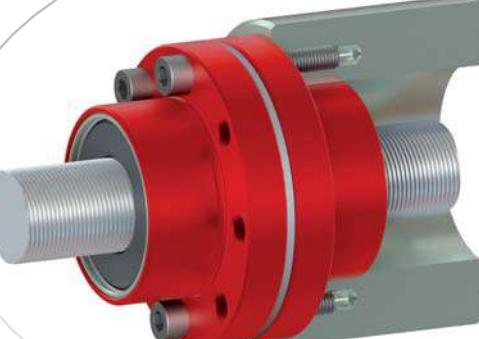

Flange nut

Extension preload

Cylindrical nut

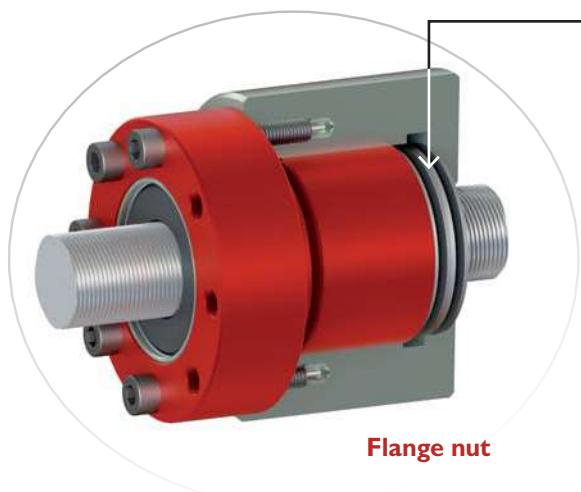

Compression preload

Central flange nut

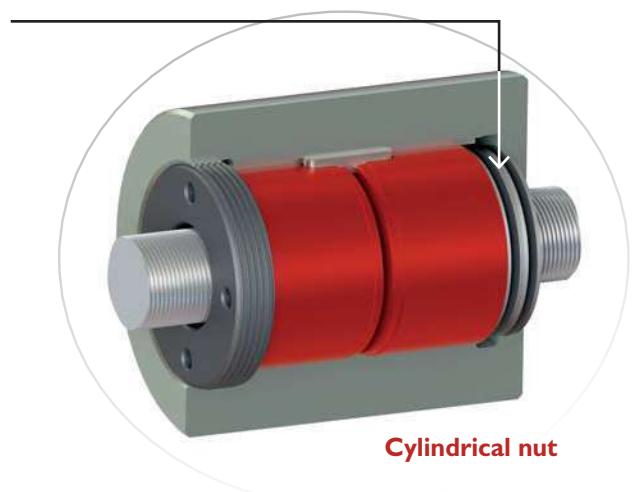

Compression preload

Preloading with elastic washers

Flange nut

*Elastic
washers*

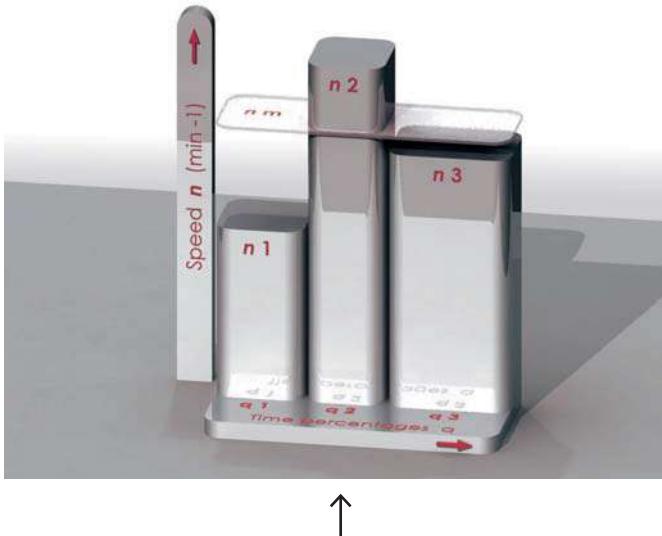

Cylindrical nut

Elastic preload makes calibration easier; however this type of preload gives an asymmetrical behaviour depending on the direction of the external load (whether path goes through the spring washer or not). Consult Rollvis for more details.

Preloading with oversized rollers

No change compared to regular single nuts for the mounting. The preload is set internally at the factory and is independant from external tightening.

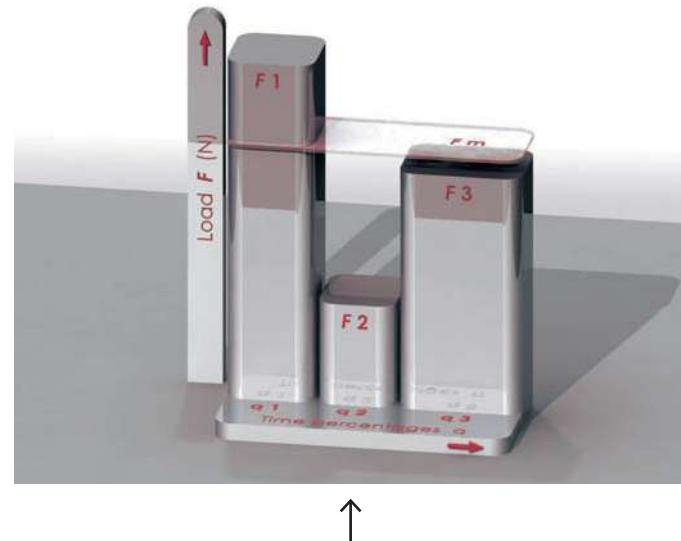

Mean speed and equivalent mean load

For variable speed and load, lifespan should be calculated with mean values n_m et F_m .

For variable speed and constant load with speed n , the mean speed n_m is used (*figure below*).

$$n_m = \frac{q_1}{100} \cdot n_1 + \frac{q_2}{100} \cdot n_2 + \dots [\text{min}^{-1}]$$

The mean load is actually an equivalent cubic mean load. For a variable load at constant speed, the mean load F_m is used (*figure below*).

$$F_m = \sqrt[3]{F_1^3 \cdot \frac{q_1}{100} + F_2^3 \cdot \frac{q_2}{100} + \dots [N]}$$

← For a variable linear load at constant speed, the mean load F_m is used (*figure below*).

$$F_m = \frac{F_{\min} + 2 \cdot F_{\max}}{3} [N]$$

n_m	$[\text{min}^{-1}]$: mean speed
$n_1 \dots n_n$	$[\text{min}^{-1}]$: individual speeds
$q_1 \dots q_n$	[%]	: time percentage
F_m	[N]	: mean load
$F; F_1 \dots F_n; F_{\min}; F_{\max}$	[N]	: actual forces

Nominal lifespan

The nominal lifespan L_{10} or L_h of a satellite roller screw corresponds to the possible achievable life considering rolling fatigue failure mode. It is evaluated with a 90% probability of survival.

If greater reliability is required, the nominal lifespan L_{10} or L_h must be multiplied by the reliability factor f_r (*table opposite*).

updated lifetime, respectively

$$L_n = L_{10} \cdot f_r \quad [\text{revolutions}]$$

$$L_{hn} = L_h \cdot f_r \quad [\text{h}]$$

Reliability %	f_r
90	1
95	0,62
96	0,53
97	0,44
98	0,33
99	0,21

Nominal lifespan of single nuts (with backlash or internal preload with oversized rollers)

The nominal lifespan of single nuts is calculated with the following formula:

$$L_{10} = \left(\frac{C_a}{F_m} \right)^3 \cdot 10^6 \quad [\text{revolutions}]$$

$$\text{or } L_h = \frac{L_{10}}{n_m \cdot 60} \quad [\text{h}]$$

The required dynamic load capacity as a function of the expected life time, can be calculated as follow:

$$C_a = F_m \cdot \sqrt[3]{\frac{L_{10}}{10^6}} \quad [\text{N}]$$

The lifespan in actual machine hours L_{hN} can be calculated considering the ratio between the roller screw life and the utilisation factor of the screw in the machine.

$$L_{hN} = \frac{L_h}{f_N} \quad [\text{h}]$$

Nominal lifespan of preloaded nuts

For preloaded nuts, it is first necessary to calculate the lifespan of each half of the nut with the corresponding dynamic load capacity C_a and the mean axial load F_{ma} (including preload). The total lifespan L_{10} of the preloaded nut is obtained with the two lifespan values $L_{10(1)}$ and $L_{10(2)}$ (in revolutions).

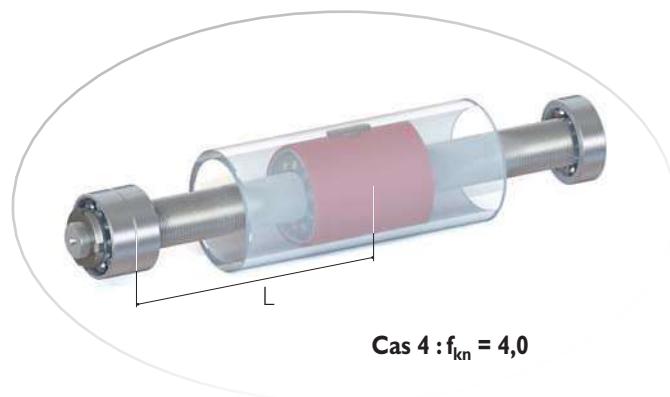

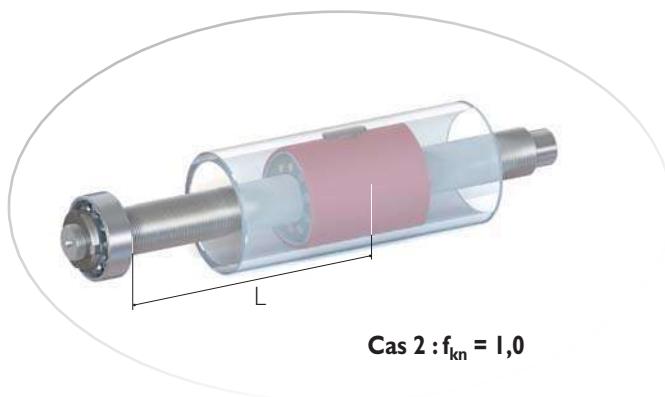

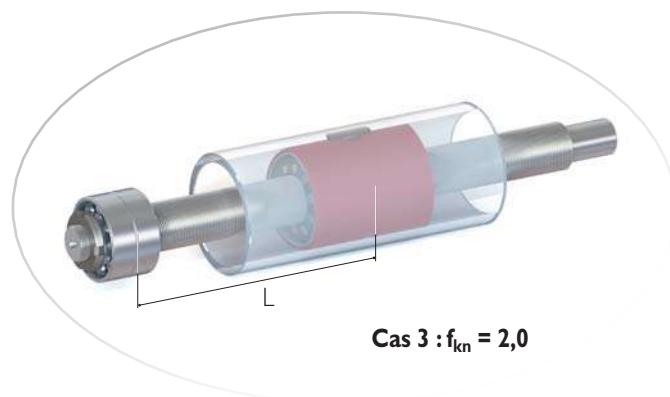

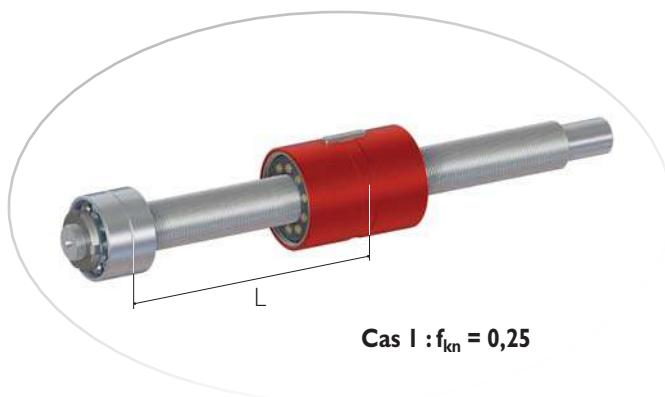

$$L_{10(1)} = \left(\frac{C_a}{F_{ma(1)}} \right)^3 \cdot 10^6 \quad [\text{revolutions}]$$

$$L_{10(2)} = \left(\frac{C_a}{F_{ma(2)}} \right)^3 \cdot 10^6 \quad [\text{revolutions}]$$

$$L_{10} = \left(L_{10(1)}^{-10/9} + L_{10(2)}^{-10/9} \right)^{-9/10} \quad [\text{revolutions}]$$

L_n	[revolutions]	: modified lifespan (revolutions)
L_{hn}	[h]	: modified lifespan (hours)
L_{10}	[revolutions]	: nominal lifespan (revolutions)
L_h	[h]	: nominal lifespan (hours)
L_{hN}	[h]	: lifetime in actual hours
f_r	[-]	: reliability factor

C_a	[N]	: dynamic load capacity
F_m	[N]	: mean load (single nut with backlash)
F_{ma}	[N]	: mean load (preloaded nut)
n_m	[min-1]	: mean speed
f_N	[-]	: utilisation factor

Satellite roller screw rigidity

The overall rigidity C_{ges} of a satellite roller screw is the combination of the following individual rigidity values:

C_{me}	nut rigidity	C_L	bearing rigidity
C_{Sp}	screw rigidity	C_u	rigidity of the surrounding construction

Permissible buckling force F_{knzul}

Permissible buckling force can be calculated with the following formula:

$$F_{knzul} = 0,8 \cdot 101,6 \cdot f_{kn} \cdot \frac{d_0^4}{L^2} \quad [\text{kN}]$$

0.8 corresponds to the safety factor.

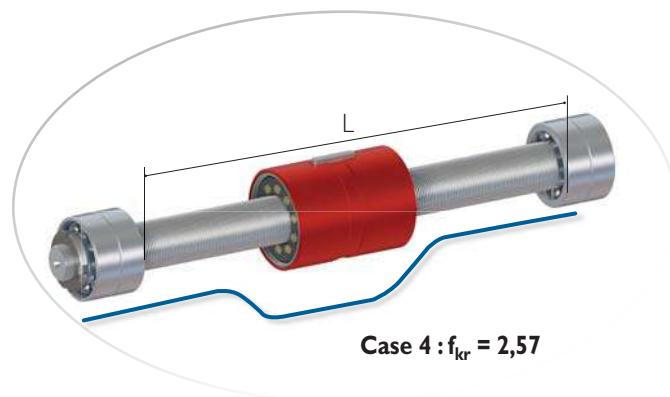

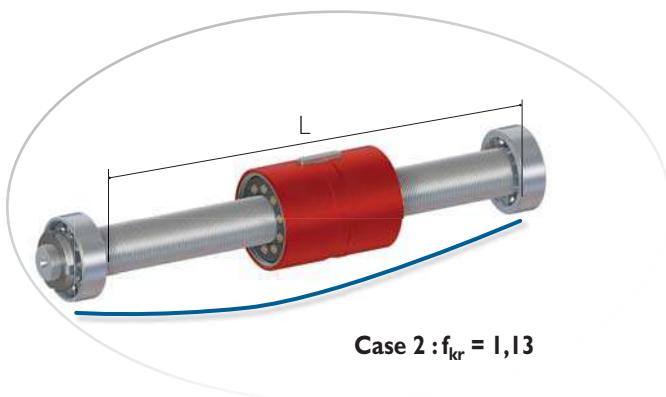

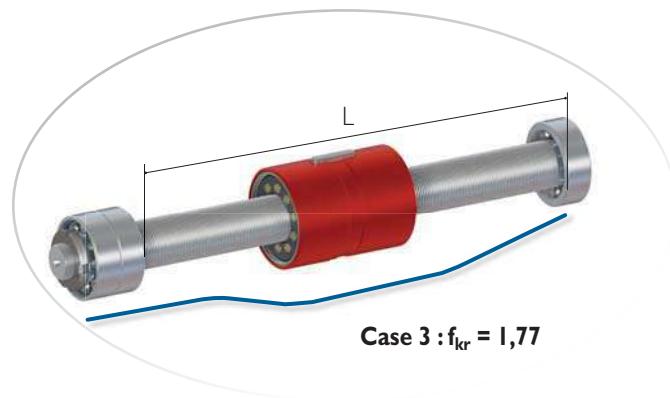

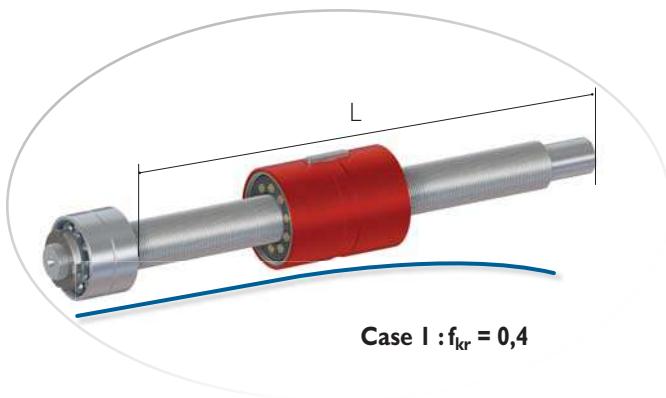

Screw rigidity C_s

Screw rigidity C_s can be calculated with the following simplified formula:

$$C_s = 164 \cdot \frac{d_0^2}{L} \quad [\text{N}/\mu\text{m}]$$

F_v	[N]	: preloading force	f_m	[\cdot]	: correction factor
F_n	[N]	: axial load	L	[mm]	: free screw length
C_{me}	[N/ μm]	: nut rigidity	d_0	[mm]	: nominal diameter of screw
C_s	[N/ μm]	: screw rigidity	F_{knzul}	[N]	: permissible buckling force
f_k	[$\text{N}^{2/3}/\mu\text{m}$]	: rigidity factor	f_{kn}	[\cdot]	: correction factor for bearing type

Rotation speed

Permissible rotation speed and axial load

Satellite roller screws are restricted by the internal configuration of the nut, the bearings at the end of the screw and the critical number of revolutions n_{kr} due to flexural vibration.

The max permissible speed n corresponds to a «never exceed speed». It is also called the limit speed. The lowest speed between n and n_{kr} has to be considered as the recommended max speed.

$$RV : d_0 \cdot n \leq 160'000$$

$$RVR : d_0 \cdot n \leq 32'000$$

$$RVI : d_0 \cdot n \leq 160'000$$

$$RVD : d_0 \cdot n \leq 100'000$$

Critical speed n_{kr} with axial load $F_n = 0$

Critical speed corresponds to the first natural frequency in bending. It is mainly depending on the limit conditions, but can also be influenced by the axial load which can give some stiffness variations.

When the correct screw end bearings are selected, their maximum speed will have no effect on the desired speed. Bearings mount give to the screw shaft a mount correction factor f_{kr} , that is then used to calculate the corresponding critical speed. (*above figures*).

The calculation is based on the assumption that satellite roller screw nuts provide no guidance and the bearings at the screw end are considered rigid in the radial direction.

$$n_{kr} = 108 \cdot 10^6 \cdot d_0 \cdot \frac{1}{L^2} \quad [\text{min}^{-1}]$$

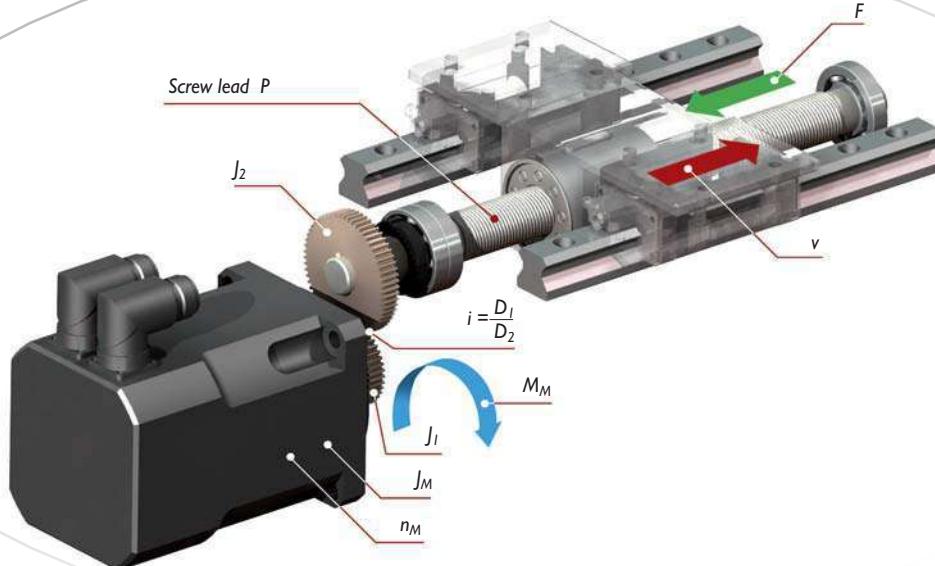

The permissible critical speed can be calculated by taking the bearing type into account:

$$n_{krzul} = 0,8 \cdot n_{kr} \cdot f_{kr} \quad [\text{min}^{-1}]$$

n [min^{-1}] : rotation speed
 n_{kr} [min^{-1}] : critical rotation speed
 n_{krzul} [min^{-1}] : permissible critical rotation speed
 L [mm] : free screw length

d_0 [mm] : nominal diameter of screw
 f_{kr} [-] : correction factor for bearing type
 $0,8$ [-] : safety factor

Driving torque

Driving torque

All the values for motor rating can be calculated with the formulas below.

Note that the load-free torque M_v must be taken into account for preloaded nuts (based on the preload force F_v).

For single nuts with backlash, the formula is: $M_v = 0 \text{ [Nm]}$

Motor driving torque M_M at constant speed

$$\text{Load-free torque} \quad M_v = \frac{F_v \cdot P \cdot i \cdot c}{2000 \cdot \pi} \quad [\text{Nm}]$$

$$\text{Direct torque («ascent load torque»)} \quad M_{L1} = \frac{P \cdot i \cdot F}{2000 \cdot \pi \cdot \eta_1} \quad [\text{Nm}]$$

Indirect torque («Descent load torque»)

The frictional forces of the guide slideway must be taken into account in feed force F .
Corresponds to the braking torque

$$M_{L2} = \frac{P \cdot i \cdot F \cdot \eta_2}{2000 \cdot \pi} \quad [\text{Nm}]$$

Motor driving torque

If, as is possible in «Descent» mode, the motor driving torque is negative,
the motor must have a brake.

$$M_M = (M_v + M_{L1,2} + M_R \cdot i) \quad [\text{Nm}]$$

$$\text{Motor driving power} \quad P_M = \frac{M_M \cdot n_M}{9,55} \quad [\text{W}]$$

d [mm]	: external diameter of screw
d_0 [mm]	: nominal diameter of the screw
d_B [mm]	: diameter of the bore of the screw shaft
d_2 [mm]	: root diameter of screw
P [mm]	: screw lead
L [mm]	: length of satellite roller screw
m_T [kg]	: mass to move
D_1 [mm]	: diameter of driving wheel
D_2 [mm]	: diameter of driven wheel
i [-]	: reduction ratio
F [N]	: feed force

F_v [N]	: preloading force
F_a [N]	: acceleration force
M_v [Nm]	: load-free torque
M_{L1} [Nm]	: «ascent» load torque at constant speed
M_{L2} [Nm]	: «descent» load torque at constant speed
M_M [Nm]	: motor driving torque
M_{La} [Nm]	: load torque on acceleration
M_B [Nm]	: acceleration torque
M_{Ma} [Nm]	: motor driving torque on acceleration
M_R [Nm]	: frictional torque of screw bearings

Motor driving torque M_{Ma} with acceleration

The rotary moment of inertia of screw J_R can be approximated with the formulae below.
Please contact Rollvis Engineering if you need exact figures of roller screw moment of inertia.

$$\text{Load torque } M_{La} = \frac{P \cdot i \cdot (F + F_a)}{2000 \cdot \pi \cdot \eta_1} \quad [\text{Nm}]$$

$$\text{Moment of inertia (translation) } J_T = m_T \cdot \left(\frac{P}{2 \cdot \pi} \right)^2 \cdot 10^{-6} \quad [\text{kgm}^2]$$

$$\text{Screw moment of inertia (rotation) } J_R = 7.66 \cdot L \cdot (d_0^4 - d_B^4) \cdot 10^{-13} \quad [\text{kgm}^2] \text{ (for steel)}$$

$$\text{Sum of reduced moments of inertia } J = J_M + J_1 + i^2 (J_R + J_T + J_2) \quad [\text{kgm}^2]$$

$$\text{Motor speed } n_M = \frac{v \cdot 6 \cdot 10^4}{P \cdot i} \quad [\text{Min}^{-1}]$$

$$\text{Acceleration torque } M_B = f(n_M) \quad M_B = \frac{n_M \cdot J}{9.55 \cdot t_B \cdot \eta} \quad [\text{Nm}]$$

$$\text{Acceleration torque } M_B = f(s_B) \quad M_B = \frac{4 \cdot \pi \cdot s_B \cdot J}{P \cdot i \cdot t_B^2 \cdot \eta} \quad [\text{Nm}]$$

$$\text{Acceleration time } t_B = f(n_M) \quad t_B = \frac{n_M \cdot J}{9.55 \cdot M_B \cdot \eta} \quad [\text{s}]$$

$$\text{Acceleration time } t_B = f(s_B) \quad t_B = \sqrt{\frac{4 \cdot \pi \cdot s_B \cdot J}{P \cdot i \cdot M_B \cdot \eta}} \quad [\text{s}]$$

$$\text{Rotation speed reached after acceleration } n_M = \frac{120 \cdot s_B}{P \cdot i \cdot t_B} \quad [\text{Min}^{-1}]$$

$$\text{Linear stroke travelled during acceleration } s_B = \frac{n_M \cdot t_B \cdot P \cdot i}{120} \quad [\text{mm}]$$

$$\text{Motor driving torque } M_{Ma} = (M_v + M_{La} + M_R \cdot i + M_B) \quad [\text{Nm}]$$

$$\text{Motor driving power } P_{Ma} = \frac{M_{Ma} \cdot n_M}{9.55} \quad [\text{W}]$$

J_M [kgm^2] : moment of inertia of motor

J_R [kgm^2] : rotary moment of inertia of screw

J_T [kgm^2] : moment of inertia of screw (translation)

J [kgm^2] : moment of inertia

J_1 [kgm^2] : moment of inertia of driving wheel

J_2 [kgm^2] : moment of inertia of driven wheel

P_M [W] : driving power of motor at constant speed

P_{Ma} [W] : driving power of motor on acceleration

s_B [mm] : acceleration path

t_B [s] : acceleration time

v [m/s] : speed rate

n_M [min $^{-1}$] : rotation speed of motor

η [-] : mechanical efficiency of gearing

η_1 [-] : mechanical efficiency of satellite roller screw
for « ascent » $\eta_1 = 0,71 \dots 0,89$

η_2 [-] : mechanical efficiency of satellite roller screw
for « descent » $\eta_2 = 0,61 \dots 0,85$

c [-] : coefficient of friction referred to preloading
 $c = 0,1 \dots 0,5$

(for efficiencies $\eta_1 + \eta_2$ see page 6)

Calculation example

Satellite roller screws RV 20 x 5

Nominal diameter	: $d_0 = 20 \text{ mm}$
Lead	: $P = 5 \text{ mm}$
Nut	: split nut (EF), preloaded
Mounting position	: horizontal
Load direction	: both sides
Rapid mode	: one side, opposite to working load

N°	Operating mode	Time percentage q [%]	Rotation speed n [min ⁻¹]	Axial load F _n [N]
1	Peak load	q ₁ = 5	n ₁ = 15	F ₁ = 8300
2	Roughing feed	q ₂ = 40	n ₂ = 110	F ₂ = 4500
3	Finishing feed	q ₃ = 50	n ₃ = 70	F ₃ = 4200
4	Rapid	q ₄ = 5	n ₄ = 1700	F ₄ = 1150

Mean speed

$$n_m = \frac{5}{100} \cdot 15 + \frac{40}{100} \cdot 110 + \frac{50}{100} \cdot 70 + \frac{5}{100} \cdot 1700 = 165 \text{ min}^{-1}$$

Preloading

For instance, preload is 1484 kN for this nut.
(This level of preload has been defined by Rollvis engineering department as a function of the application conditions)

$$F_v = \frac{4200}{2.83} = 1484 \text{ N}$$

Load on nut half 1

Nut half 1 is loaded in operating modes 1, 2 and 3.
As F₁, F₂ and F₃ ≥ 2.83 F_v:

$$F_{nv} = F_n \quad \text{et ainsi} \quad F_{1v} = 8300 \text{ N} \\ F_{2v} = 4500 \text{ N} \\ F_{3v} = 4200 \text{ N}$$

Nut half 1 is only partly loaded in operating mode 4.
As F₄ = 1150 N < 2.83 F_v:

$$F_{4v} = 1484 - 0.35 \cdot 1150 = 1082 \text{ N}$$

Load on nut half 2

Half nut 2 is loaded in operating mode 4.
Half nut 2 is not loaded in operating modes 1, 2 and 3.

$$F_{1v} = F_{2v} = F_{3v} = 0$$

As F₄ < 2.83 . F_v, on a :

$$F_{4v} = 1484 + 0.65 \cdot 1150 = 2232 \text{ N}$$

Equivalent Mean load

$$\text{Nut 1} \quad F_{ma(1)} = \sqrt[3]{8300^3 \cdot \frac{15}{165} \cdot \frac{5}{100} + 4500^3 \cdot \frac{110}{165} \cdot \frac{40}{100} + 4200^3 \cdot \frac{70}{165} \cdot \frac{50}{100} + 1082^3 \cdot \frac{1700}{165} \cdot \frac{5}{100}} = 3511 \text{ N}$$

$$\text{Nut 2} \quad F_{ma(2)} = \sqrt[3]{2232^3 \cdot \frac{1700}{165} \cdot \frac{5}{100}} = 1789 \text{ N}$$

Lifespan

Dynamic load capacity of a nut C_a = 23 400 N

$$\text{Half nut 1} \quad L_{10(1)} = \left(\frac{23400}{3511} \right)^3 \cdot 10^6 = 296 \cdot 10^6 \text{ revolutions}$$

$$\text{Half nut 2} \quad L_{10(2)} = \left(\frac{23400}{1789} \right)^3 \cdot 10^6 = 2237 \cdot 10^6 \text{ revolutions}$$

Total lifespan

$$L_{10} = [(296 \cdot 10^6)^{-10/9} + (2237 \cdot 10^6)^{-10/9}]^{-9/10}$$
$$L_{10} = 270 \cdot 10^6 \text{ revolutions}$$

Lifespan in hours (with utilisation factor $f_N = 0.6$)

$$L_{hN} = \frac{270 \cdot 10^6}{165 \cdot 0,6 \cdot 60} = 45\,450 \text{ h}$$

Satellite roller screw rigidity

Free length between fixed bearing and nut
Nominal diameter of screw

$L = 1000 \text{ mm}$
 $d_0 = 20 \text{ mm}$

$$C_S = 164 \cdot \frac{20^2}{1000} = 66 \text{ N}/\mu\text{m}$$

Bearing rigidity

$$C_1 = 850 \text{ N}/\mu\text{m} \text{ (refer to bearing catalogs)}$$

Driving torque

Driving torque M_M is calculated for the peak load of $F_1 = 8300 \text{ N}$.

The screw is directly driven by the motor ($i = 1$):

Load-free torque:

$$M_V = \frac{1484 \cdot 5 \cdot 1 \cdot 0.43}{2000 \cdot \pi} = 0.5 \text{ Nm}$$

Load torque:

$$M_{L1} = \frac{5 \cdot 1 \cdot 8300}{2000 \cdot \pi \cdot 0.87} = 7.6 \text{ Nm}$$

Frictional torque of bearings:

$$M_R = 0.2 \text{ Nm (admitted)}$$

Peak driving torque of motor at constant speed:

$$M_{Mmax} = 0.5 + 7.6 + 0.2 = 8.3 \text{ Nm}$$

Motor driving power reaches its peak in rapid mode with $F_4 = 1150 \text{ N}$.

Moment en Load torque:

$$M_{L4} = \frac{5 \cdot 1 \cdot 1150}{2000 \cdot \pi \cdot 0.87} = 1.05 \text{ Nm}$$

Peak driving power of motor at constant speed:

$$P_{Mmax} = \frac{(1.05 + 0.5 + 0.2) \cdot 1700}{9.55} = 312 \text{ W}$$

Lubrication

Lubricants used for satellite roller screws are generally close to the ones used for gears and bearings. Oil or grease can both be used, depending on the application conditions and how maintenance is managed. Without specific request from customer, Rollvis use its standard grease. As a function of customer's application, we are able to define and offer the most appropriate lubricant.

Oil lubrication

Circulating mineral oils with EP additives to enhance resistance to aging and corrosion in compliance with CL based on DIN 51517, part 2, are especially suitable for the lubrication of satellite roller screws. Speed, ambient temperature and operating temperature are determining factors in the choice of viscosity.

The amount of oil required depends on the screw diameter, the number of supporting rollers and the amount of heat to dissipate. 1 cm³/h (for small screw diameters) to 30 cm³/h (for large screw diameters) can be used as reference values. Rollvis Engineering can support to calculate the power to be dissipated by the screw and make recommendation on the flow of oil to cool down the screw.

The shortest possible lubrication intervals (...5 minutes) are recommended for high loads and longer intervals (5 minutes to 1 hr) for low loads. Automatic lubrication is recommended for high loads and speeds.

For immersion lubrication, the oil level should be such that the bottommost roller is completely submerged in the oil. The amount of oil and the oil-change intervals depend on the loading and installation.

The viscosity of the oil should be chosen to enable an adequate film of lubricant to form on the contact surfaces.

Figure a shows the operating viscosity ν_K to achieve for the mean speed of the satellite roller screw and screw diameter.

Viscosity ν_K ensures a state of lubrication to fulfil the nominal lifespan provided the lubrication system is free of foreign bodies.

Nominal viscosity can be calculated on the basis of viscosity ν_K with the viscosity-temperature diagram (diagram ν -t, **figure b**) and the operating temperature. Nominal viscosity is the viscosity of oil at 40°C. Viscosity classes ISO VG (DIN 51519) are plotted in diagram ν -t.

Figure a shows the nominal diameters of RV satellite roller screws. The diameters of RVR satellite roller screws are slightly different. The required operating viscosity values can be obtained by interpolation.

Intermediate values can be obtained from the steps. These must be rounded up to the nearest viscosity value.

The operating temperature must be known or estimated to calculate nominal viscosity. The operating temperature must be measured on the nut after stabilisation. A suitable oil can be found in oil suppliers' lists with the nominal viscosity at 40°C. In general, an operating temperature of 30°C* can be taken as a basis for selecting a lubricant.

Example: Satellite roller screw RV 39 x 10
Mean operating speed: $n_m = 1400 \text{ min}^{-1}$
Operating temperature (estimated): $t = 25^\circ\text{C}$

In **figure a**, for a speed $n_m = 1400 \text{ min}^{-1}$ and a nominal diameter of 39mm, the nominal viscosity is $\nu_K = 33 \text{ mm}^2/\text{s}$.

After the nominal viscosity has been defined, we recommend to apply a viscosity factor that can be estimated as the function of the loading conditions (**Figure a'**).

For instance if for this application the mean load is 56kN, then the ratio is about 30% which gives a factor of 3.

The corrected nominal viscosity is then 100 cst.

In diagram ν -t (**figure b**), the 25°C temperature and 100 mm²/s viscosity lines intersect with line ISO VG 46. The oil to select must have at least this viscosity if operating temperature is stabilized at 25°C. Note that a higher viscosity would also be possible but we do not recommend to choose a lower one.

A suitable CLP (DIN 51517) or HLP (DIN 51525) oil can be selected from this class.

* In case operating conditions are not known, Rollvis recommends using an oil with about 150 cst viscosity at 40°C.

Grease lubrication

For satellite roller screw, grease is usually preferred as a lubricant. Grease with lithium, barium or calcium thickeners are preferred. The chosen grease must have a viscosity at least 100 to 150 cst at 40°C, grade II and with specific additives. Lubrication recommendation are different when an automatic lubrication system is used.

Lubrication intervals depend on the screw arrangement, size and operating conditions. Rollvis can provide recommendations for any type of application.

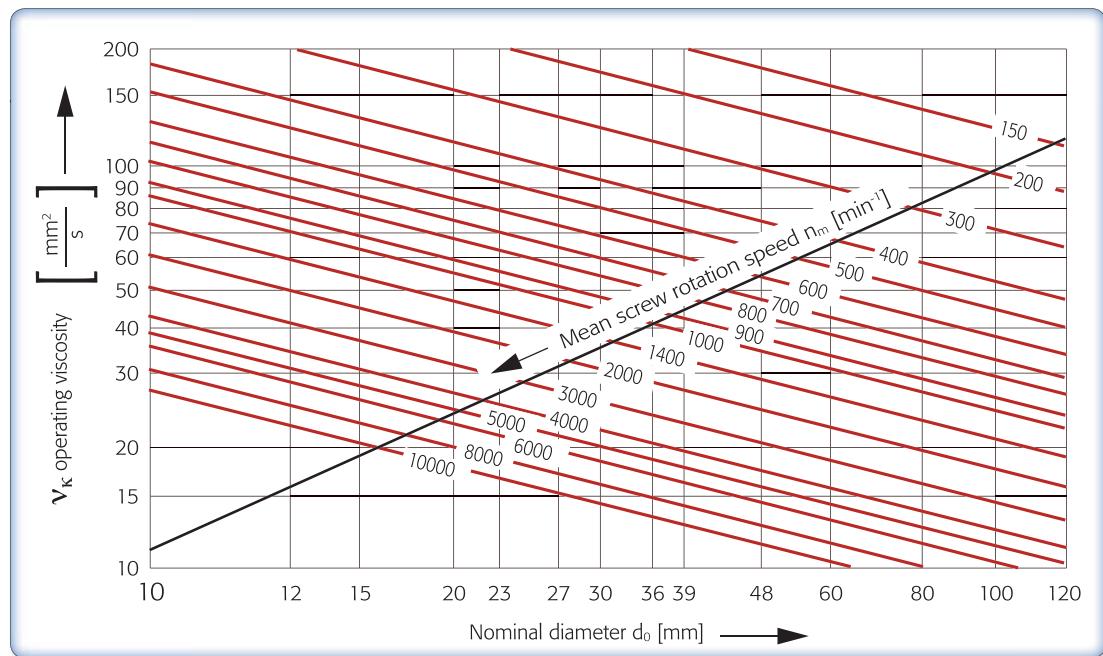

Figure a

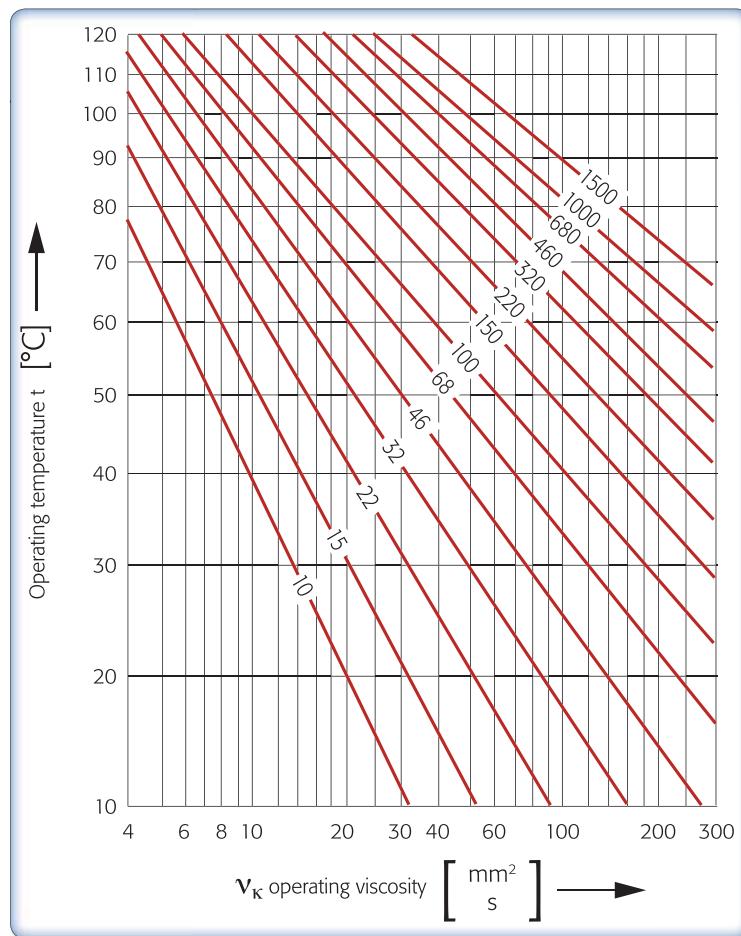

Figure b

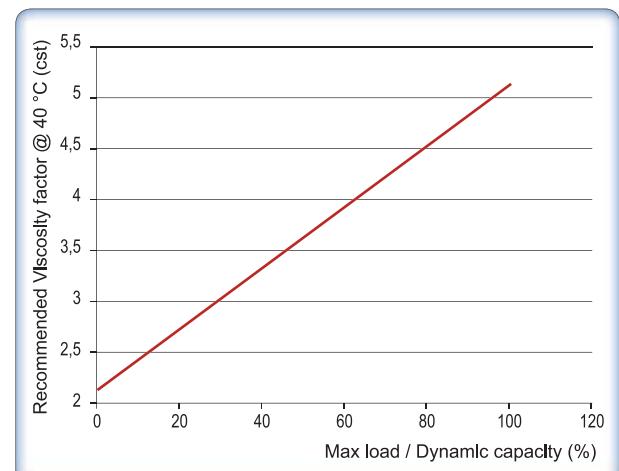

Figure a'

Handling advice

Assembly

If possible, the nut should not be removed from the screw shaft. However, should this be necessary, an assembly sleeve must be used. External diameter of assembly sleeve:

External diameter of the assembly sleeve $d_3 = d_2 + 0.05$
(d_2 = screw core diameter)

Screw assembly

The following points must be followed when assembling the screw:

- 1 • Align the screw and slide guideways axially parallel.
- 2 • Fix the nut in housing.
- 3 • Run the nut along the entire length of the thread and check the screw for ease of movement

CAUTION

RV screws always have a multiple-start thread. If the friction torque is slightly different after the nut is reassembled, the nut can be taken off again and reinstalled on the next thread start until friction torque is back to the original level !

Handling

Please heed strictly the following instructions to ensure an optimal operation and a long lifetime of the satellite roller screw.

Please, feel free to contact Rollvis for more information or if you have any question.

Lubrication

Satellite roller screws are greased prior to shipment (unless oil lubrication is requested).

Do not remove this grease. **Only use this type of grease for relubrication.**

Transport

Handle screws with care: do not let boxes or crates drop. Lift and handle so that the thread does not get damaged.

Installation

Do not remove the nut from the shaft (or only with an assembly sleeve). Carefully align satellite roller screws parallel to the guideways. Alignment errors may generate side loads, create additional friction or noise and may damage the screw.

Storage

Only remove satellite roller screws from their original packing just before installation.

Bending

Design and installation must prevent radial forces or tilting moments on the nut.

Bearing units for satellite roller screws - Standard types of assembly available

Nominal fatigue lifetime for axial loaded bearings:

$$L_{10} = \left(\frac{C_a}{F_m}\right)^3 \text{ revolutions} \quad \text{Respectively} \quad L_h = \frac{L_{10}}{n_m \cdot .60} \quad [h]$$

Nominal fatigue lifetime for the bearing unit:

All bearing units are preloaded to ensure optimal support. When loads are applied in the two different axial directions, bearing unit lifetime calculation depends on equivalent mean axial load F_m (considering preload) and on the equivalent dynamic capacity of each set of bearings assembled in the same direction. As a result, with the two lifetime values $L_{10(1)}$ and $L_{10(2)}$ (revolutions), we can calculate the global bearing unit lifetime.

$$L_{10(1)} = \left(\frac{C_{a1}}{F_{ma(1)}}\right)^3 \cdot 10^6 \text{ revolutions}$$

$$L_{10(2)} = \left(\frac{C_{a2}}{F_{ma(2)}}\right)^3 \cdot 10^6 \text{ revolutions}$$

$$L_{10} = \left(L_{10(1)}^{-10/9} + L_{10(2)}^{-10/9}\right)^{-9/10} \text{ revolutions}$$

Application data list for roller screws

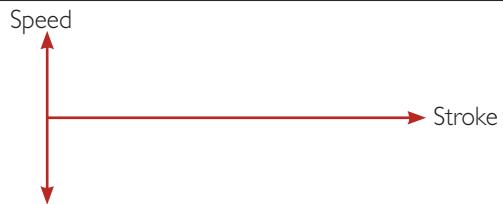

Operating conditions :

Number of screws supporting the lead :

Max static load :

Max. dynamic load :

Typical load chart (function of the stroke, forward and reverse stroke) :

Maximal linear speed of the application :

Stroke :

length of screw :

Main load : Compression

Tension

Rotation : Nut

Screw shaft

Positioning of the screw : Vertical

Horizontal

Specific limitations : Vibrations

Shocks

Expected lifetime Nb of cycles :

Total time required - years-month :

Environnement : Humidity / Fluid / Dust :

Temperature range :

Geometric limitations : Nut/Shft max diameter/Length :

Interfaces :

Motor torque :

Lubrification requirement :

Preload - Backlash - Accuracy - Stiffness :

Lead accuracy : G5 (23µm/300mm) G3 (12µm/300mm) G1 (6µm/300mm)

Manufacturing tolerances (ISO 3408-3) : Class 5 Class 3 Class 1

Axial backlash : Standard Without backlash Preloading/Stiffness

Nut : Flange Cylindrical Double Specific design

Mounting conditions of the roller screw

Fixed - Free : XX —

Fixed - Supported : XX — X

Fixed - Fixed : XX — XX

Supported - Supported : X — X

Notes / Remarks / Sketch :
